- **<u>Bid price</u>** The prices at which investors are willing to buy shares.
- **<u>Ask price</u>** The prices at which current shareowners are willing to sell their shares.
- **<u>Bid-ask spread</u>** The difference between the bid price and the ask price.
- <u>Market order</u> An order to buy or sell shares at the best currently available market price.
- <u>Limit order</u> An order to buy or sell shares at a predetermined price, to be executed when the market price reaches the requested price.

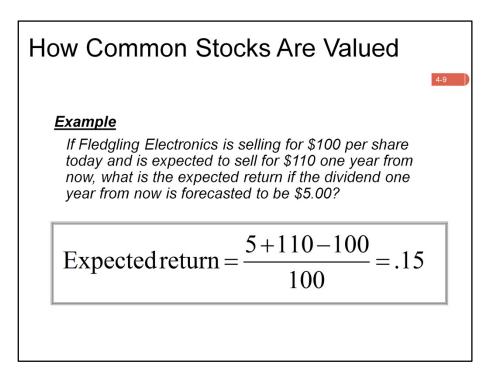

How Common Stocks Are Valued

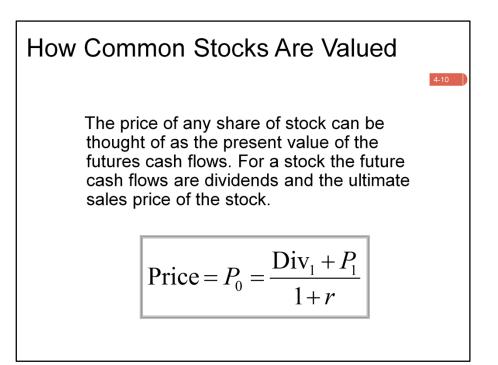

The value of any stock is the present value of its future cash flows. This reflects the DCF formula. Dividends represent the future cash flows of the firm.

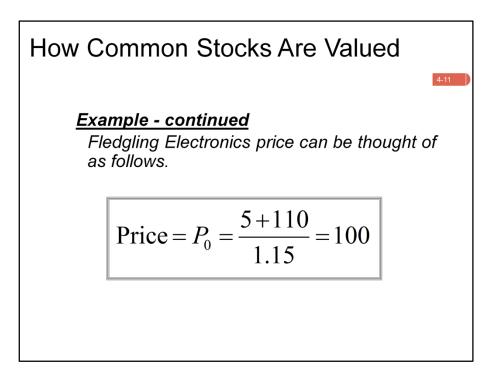

4-7

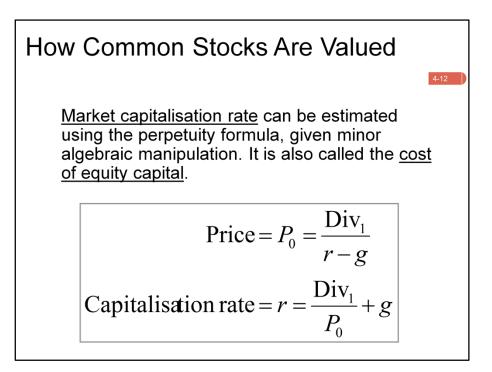

PV(stock) = PV(expected future dividends)

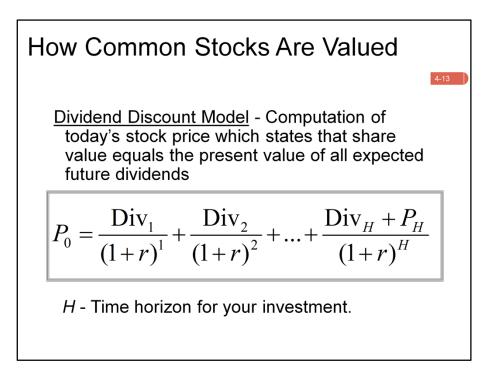

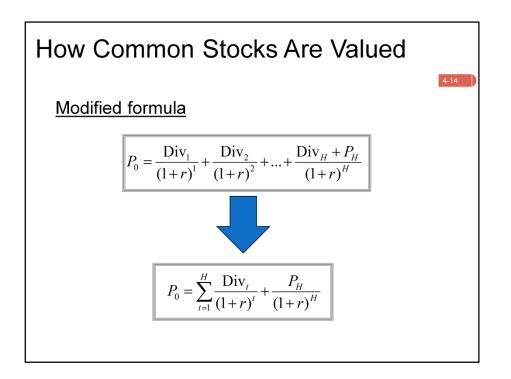

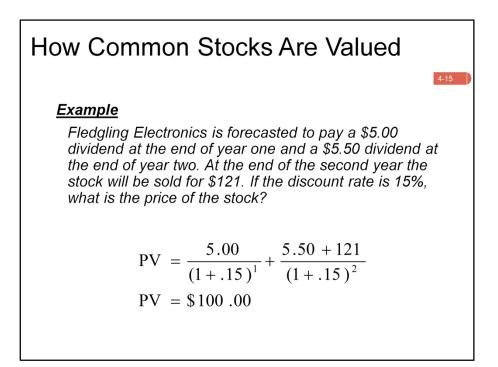

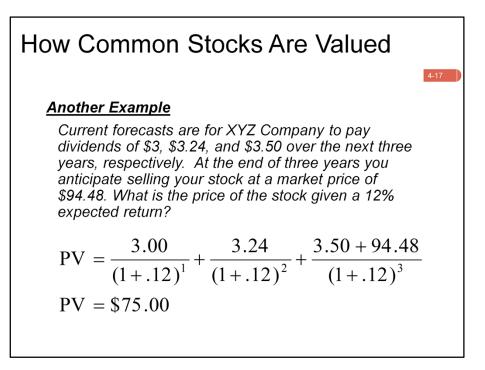

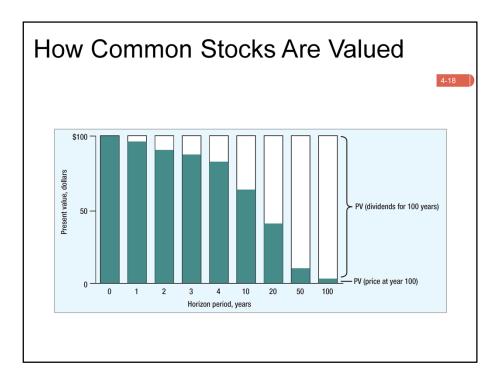

How Common Stocks Are Valued

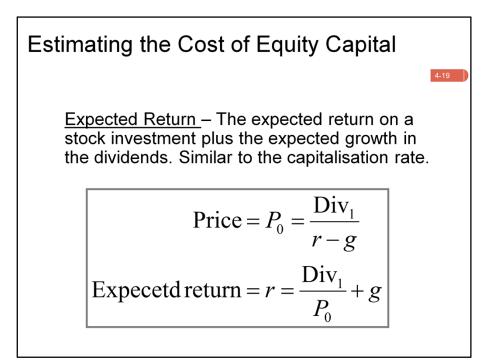

Another Example

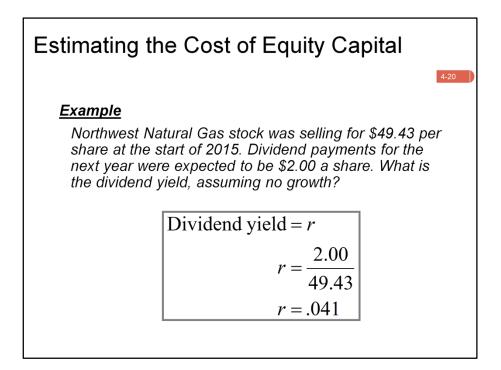

Current forecasts are for XYZ Company to pay dividends of \$3, \$3.24, and \$3.50 over the next three years, respectively. At the end of three years you anticipate selling your stock at a market price of \$94.48. What is the price of the stock given a 12% expected return?

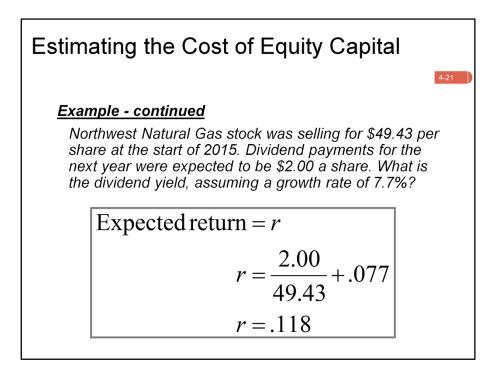

4-16

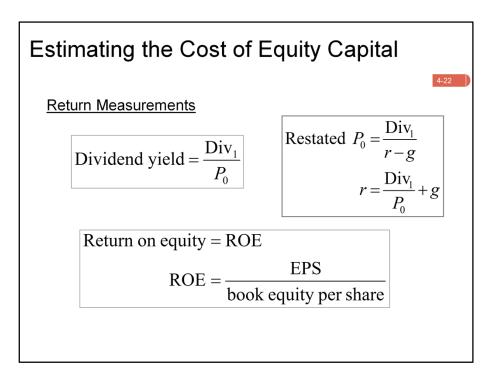

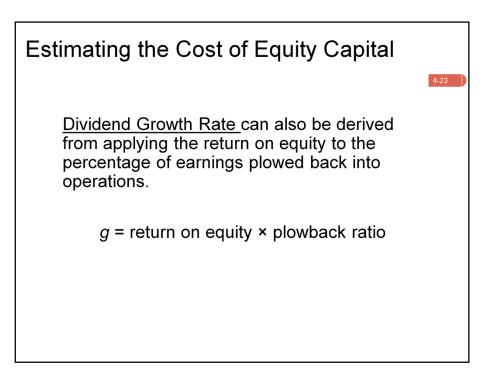

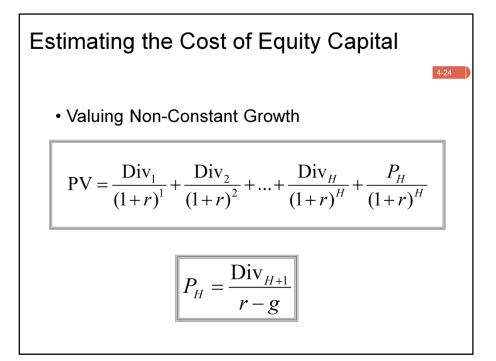

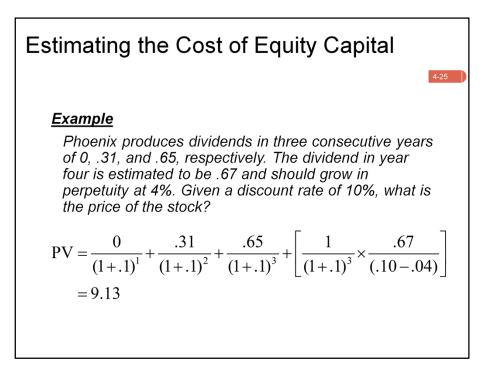

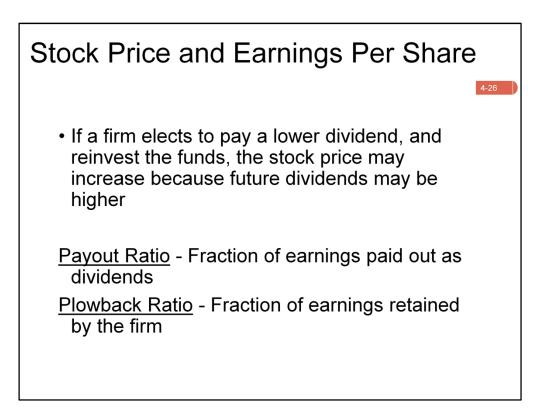

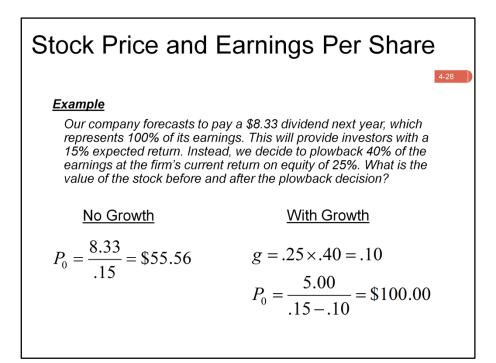

Stock Price and Earnings Per Share

4-27

<u>Example</u>

Our company forecasts to pay a \$8.33 dividend next year, which represents 100% of its earnings. This will provide investors with a 15% expected return. Instead, we decide to plowback 40% of the earnings at the firm's current return on equity of 25%. What is the value of the stock before and after the plowback decision?

Stock Price and Earnings Per Share

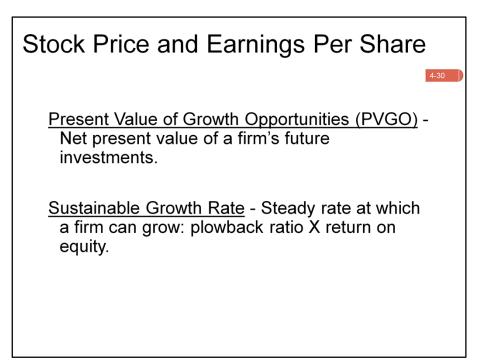

Example - continued

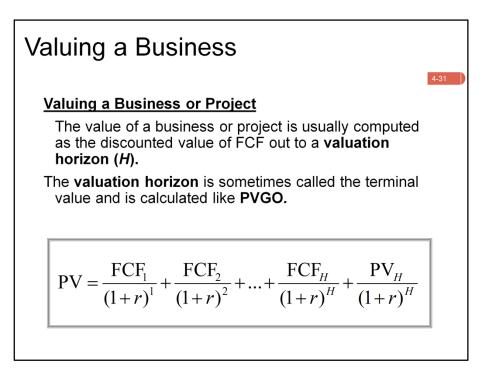

If the company did not plowback some earnings, the stock price would remain at \$55.56. With the plowback, the price rose to \$100.00.

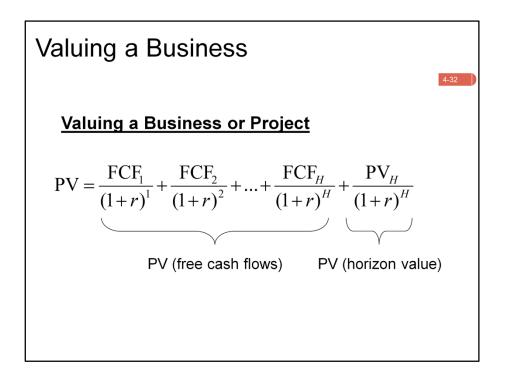

4-29

The difference between these two numbers is called the present value of growth opportunities (PVGO).

PVGO = 100.00 - 55.56 = \$44.44

Valuing a Business

<u>Example</u>

Given the cash flows for Concatenator Manufacturing Division, calculate the PV of near term cash flows, PV (horizon value), and the total value of the firm when r = 10% and g = 6%.
