

CHAPTER

7

○○○

# INTRODUCTION TO RISK AND RETURN

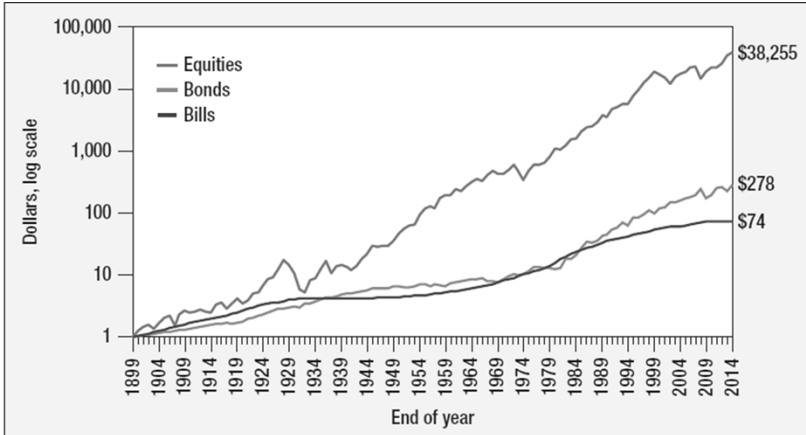

## Topics Covered

7-2

- Over a Century of Capital Market History in One Easy Lesson
- Measuring Portfolio Risk
- Calculating Portfolio Risk
- How Individual Securities Affect Portfolio Risk
- Diversification & Value Additivity

# The Value of an Investment of \$1 in 1899

7-3

# The Value of an Investment of \$1 in 1899

7-4

## Real Returns

## Average Market Risk Premiums (by country)

7-5

# Dividend Yield

7-6

Dividend yields in the U.S. 1900–2014

# Rates of Return 1900-2011

## Stock Market Index Returns

Source: E. Dimson, P. R. Marsh, and M. Staunton, *Triumph of the Optimists: 101 Years of Investment Returns* (Princeton, NJ: Princeton University Press, 2002), with updates provided by the authors.

# Measuring Risk

7-8

Histogram of Annual Stock Market Returns (1900-2014)

# Measuring Risk

7-9

## **Variance**

- Average value of squared deviations from mean
- A measure of volatility

## **Standard Deviation**

- Average value of squared deviations from mean
- A measure of volatility

# Measuring Risk

7-10

## Coin Toss Game-calculating variance and standard deviation

(1) Percent Rate of Return ( $\tilde{r}$ )	(2) Deviation from Expected Return ( $\tilde{r} - r$ )	(3) Squared Deviation ( $\tilde{r} - r$ ) <sup>2</sup>	(4) Probability	(5) Probability × Squared Deviation
+40	+30	900	0.25	225
+10	0	0	0.5	0
-20	-30	900	0.25	225

Variance = expected value of  $(\tilde{r} - r)^2 = 450$   
Standard deviation =  $\sqrt{\text{variance}} = \sqrt{450} = 21$

## Measuring Risk

$$\begin{aligned} \text{Portfolio rate} &= \left( \begin{array}{l} \text{fraction of portfolio} \\ \text{in first asset} \end{array} \right) \times \left( \begin{array}{l} \text{rate of return} \\ \text{on first asset} \end{array} \right) \\ \text{of return} &+ \left( \begin{array}{l} \text{fraction of portfolio} \\ \text{in second asset} \end{array} \right) \times \left( \begin{array}{l} \text{rate of return} \\ \text{on second asset} \end{array} \right) \end{aligned}$$

# Equity Market Risk (by country)

7-12

Average Risk (1900-2014)

# Dow Jones Risk

7-13

Annualised Standard Deviation of the DJIA over the preceding 52 weeks  
(1900 – 2014)

# Measuring Risk

7-14

**Diversification** - Strategy designed to reduce risk by spreading the portfolio across many investments.

**Unique Risk** - Risk factors affecting only that firm. Also called “diversifiable risk.”

**Market Risk** - Economy-wide sources of risk that affect the overall stock market. Also called “systematic risk.”

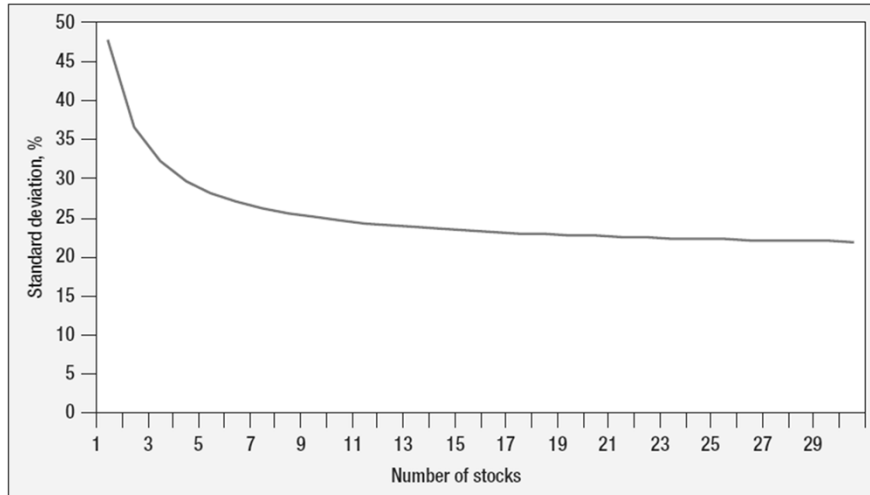

# Comparing Returns

7-15

The value of a portfolio evenly divided between Newmont Mining and Ford was less volatile than either stock on its own. The assumed initial investment is \$100.

# Measuring Risk

# Measuring Risk

# Portfolio Risk

The variance of a two stock portfolio is the sum of these four boxes

	Stock 1	Stock 2
Stock 1	$x_1^2 \sigma_1^2$	$x_1 x_2 \sigma_{12} =$ $x_1 x_2 \rho_{12} \sigma_1 \sigma_2$
Stock 2	$x_1 x_2 \sigma_{12} =$ $x_1 x_2 \rho_{12} \sigma_1 \sigma_2$	$x_2^2 \sigma_2^2$

## Portfolio Risk

7-19

### **Example**

*Suppose you invest 60% of your portfolio in JNJ and 40% in Ford. The expected dollar return on your JNJ is 8.0% and on Ford is 18.8%. The expected return on your portfolio is:*

$$\text{Expected return} = (.60 \times 8.0) + (.40 \times 18.8) = 12.3\%$$

# Portfolio Risk

## Example

Suppose you invest 60% of your portfolio in JNJ and 40% in Ford. The expected dollar return on your JNJ is 8.0% and on Ford is 18.8%. The standard deviation of their annualised daily returns are 13.2% and 31.0%, respectively. Assume a correlation coefficient of 1.0 and calculate the portfolio variance.

	JNJ	Ford
JNJ	$x_1^2 \sigma_1^2 = (.60)^2 \times (13.2)^2$	$x_1 x_2 \rho_{12} \sigma_1 \sigma_2 = .40 \times .60 \times 1 \times 13.2 \times 31.0$
Ford	$x_1 x_2 \rho_{12} \sigma_1 \sigma_2 = .40 \times .60 \times 1 \times 13.2 \times 31.0$	$x_2^2 \sigma_2^2 = (.40)^2 \times (31.0)^2$

## Portfolio Risk

### **Example**

Suppose you invest 60% of your portfolio in JNJ and 40% in Ford. The expected dollar return on your JNJ is 8.0% and on Ford is 18.8%. The standard deviation of their annualized daily returns are 13.2% and 31.0%, respectively. Assume a correlation coefficient of 1.0 and calculate the portfolio variance.

$$\begin{aligned}\text{Portfolio variance} &= [(.60)^2 \times (13.2)^2] \\ &\quad + [(.40)^2 \times (31.0)^2] \\ &\quad + 2(.40 \times .60 \times 1 \times 13.2 \times 31.0) = 412.90\end{aligned}$$

$$\text{Standard deviation} = \sqrt{412.90} = 20.3\%$$

# Portfolio Risk

## Example

Suppose you invest 60% of your portfolio in JNJ and 40% in Ford. The expected dollar return on your JNJ is 8.0% and on Ford is 18.8%. The standard deviation of their annualized daily returns are 13.2% and 31.0%, respectively. Assume a correlation coefficient of .019 and calculate the portfolio variance.

$$\begin{aligned}\text{Portfolio variance} &= [(.60)^2 \times (13.2)^2] \\ &\quad + [(.40)^2 \times (31.0)^2] \\ &\quad + 2(.40 \times .60 \times 0.19 \times 13.2 \times 31.0) = 253.80\end{aligned}$$

$$\text{Standard deviation} = \sqrt{253.80} = \boxed{15.90\%}$$

# Portfolio Risk

## **Another Example**

*Suppose you invest 60% of your portfolio in JNJ and 40% in Ford. The expected dollar return on your JNJ is 8.0% and on Ford is 18.8%. The standard deviation of their annualized daily returns are 13.2% and 31.0%, respectively. Assume a correlation coefficient of -1.00 and calculate the portfolio variance.*

$$\begin{aligned}\text{Portfolio variance} &= [(.60)^2 \times (13.2)^2] \\ &\quad + [(.40)^2 \times (31.0)^2] \\ &\quad + 2(.40 \times .60 \times (-1.00) \times 13.2 \times 31.0) = 20.1\end{aligned}$$

$$\text{Standard deviation} = \sqrt{20.10} = \boxed{4.50\%}$$

## Portfolio Risk

$$\text{Expected portfolio return} = (x_1 r_1) + (x_2 r_2)$$

$$\text{Portfolio variance} = x_1^2 \sigma_1^2 + x_2^2 \sigma_2^2 + 2(x_1 x_2 \rho_{12} \sigma_1 \sigma_2)$$

# Portfolio Risk

7-25

## **Example**

Correlation Coefficient = .4

<u>Stocks</u>	<u><math>\sigma</math></u>	<u>% of Portfolio</u>	<u>Avg Return</u>
ABC Corp	28	60%	15%
Big Corp	42	40%	21%

Standard deviation = weighted avg = 33.6

Standard deviation = Portfolio = 28.1

Real standard deviation:

$$\begin{aligned} &= (28^2)(.6^2) + (42^2)(.4^2) + 2(.4)(.6)(28)(42)(.4) \\ &= \underline{28.1} \text{ CORRECT} \end{aligned}$$

Return :  $r = (15\%)(.60) + (21\%)(.4) = 17.4\%$

# Portfolio Risk

7-26

Example Correlation Coefficient = .4

<u>Stocks</u>	<u><math>\sigma</math></u>	<u>% of Portfolio</u>	<u>Avg Return</u>
ABC Corp	28	60%	15%
Big Corp	42	40%	21%

Standard deviation = weighted avg = 33.6

Standard deviation = portfolio = 28.1

Return = weighted avg = portfolio = 17.4%

Let's add New Corp. stock to the portfolio

# Portfolio Risk

7-27

Example Correlation Coefficient = .3

Stocks	$\sigma$	% of Portfolio	Avg Return
Portfolio	28.1	50%	17.4%
New Corp	30	50%	19%

NEW standard deviation = weighted avg = 31.80

NEW standard deviation = portfolio = 23.43

NEW return = weighted avg = portfolio = 18.20%

NOTE: Higher return & Lower risk

How did we do that? DIVERSIFICATION

# Portfolio Risk

7-28

The shaded boxes contain variance terms; the remainder contain covariance terms.

	Stock							
	1	2	3	4	5	6	7	$N$
1								
2								
3								
4								
5								
6								
7								
$N$								

**To calculate  
portfolio  
variance add  
up the boxes**

## Portfolio Risk, Beta

Market Portfolio - Portfolio of all assets in the economy. In practice a broad stock market index, such as the S&P Composite, is used to represent the market.

Beta - Sensitivity of a stock's return to the return on the market portfolio.

# Portfolio Risk, Beta

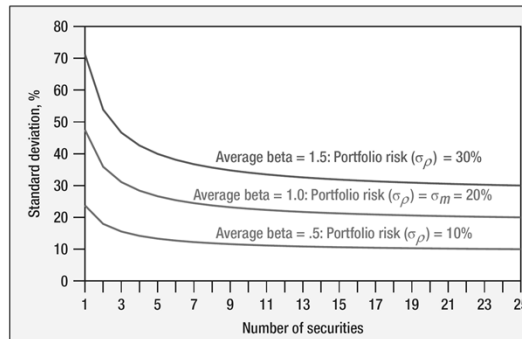

7-30

The return on Ford stock changes on average by 1.44% for each additional 1% change in the market return. Beta is therefore 1.44.

## Portfolio Risk, Beta

The green line shows that a well diversified portfolio of randomly selected stocks ends up with  $\beta = 1$  and a standard deviation equal to the market's—in this case 20%. The upper red line shows that a well diversified portfolio with  $\beta = 1.5$  has a standard deviation of about 30%—1.5 times that of the market. The lower blue line shows that a well-diversified portfolio with  $\beta = .5$  has a standard deviation of about 10%—half that of the market.

## Portfolio Risk, Beta

$$B_i = \frac{\sigma_{im}}{\sigma_m^2}$$

Covariance with the market

Variance of the market

# Portfolio Risk, Beta

7-33

Calculating the variance of the market returns and the covariance between the returns on the market and those of Anchovy Queen. Beta is the ratio of the variance to the covariance (i.e.,  $\beta = \sigma_{im} / \sigma_m^2$ )

1	(1)	(2)	(3)	(4)	(5)	(6)	(7)
2							Product of
3				Deviation	Deviation	Squared	deviations
4				from	from average	deviation	from average
5		Market	Anchovy Q	average	Anchovy Q	from average	returns
6	Month	return	return	market return	return	market return	(cols 4 × 5)
7	1	-8%	-11%	-10	-13	100	130
8	2	4	8	2	6	4	12
9	3	12	19	10	17	100	170
10	4	-6	-13	-8	-15	64	120
11	5	2	3	0	1	0	0
12	6	8	6	6	4	36	24
13	Average	2	2		Total	304	456
14					Variance = $\sigma_m^2 = 304/6 = 50.67$		
15					Covariance = $\sigma_{im} = 456/6 = 76$		
16					Beta ( $\beta$ ) = $\sigma_{im} / \sigma_m^2 = 76/50.67 = 1.5$
